As part of your learning journey, try creating two separate versions of the projects: one static and one dynamic. The static version will use only HTML and CSS, while the dynamic version will include backend functionality using PHP and a MySQL database.
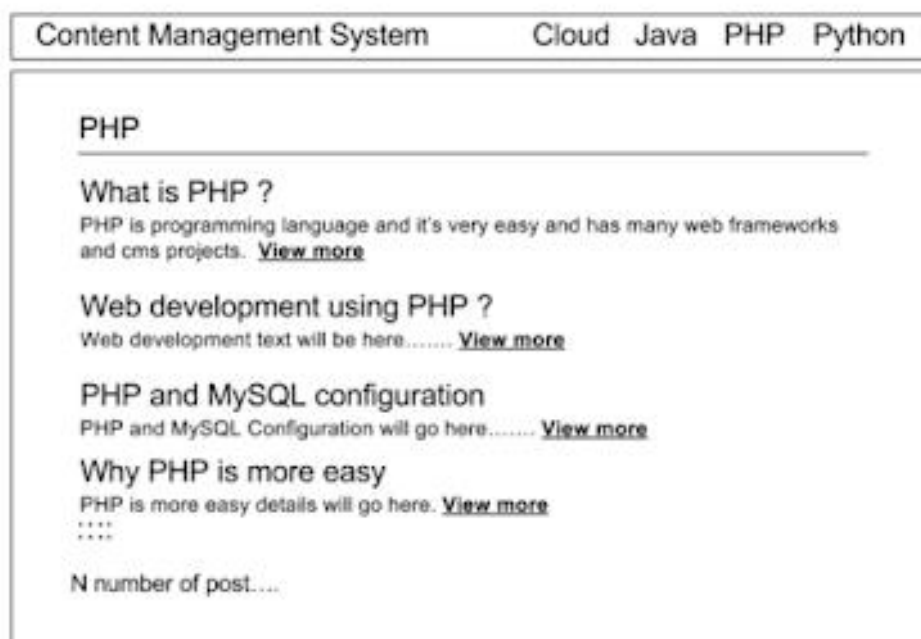

Below are the detailed requirements

I need to build a Content Management System (CMS) and implement the functionalities outlined below

Home Page

For example, when the user clicks on 'PHP', the system should display all posts related to PHP

When a user clicks on any post listed on the page, it should open and display detailed information about the selected post.

```
┌─────────────────────────────────────────────────────────────┐
│ Content Management System        Cloud   Java   PHP   Python │
├─────────────────────────────────────────────────────────────┤
│  What is PHP ?                                               │
│                                              Home > PHP      │
│  ─────────────────────────────────────────                  │
│  PHP is programming language and it's very easy and has many web frameworks │
│  and cms projects………                                        │
│                                                             │
│                                                             │
│  Paragraph - 2                                              │
│                                                             │
│  Paragraph - 3                                              │
│                                                             │
│  ….                                                         │
│                                                             │
│                                                             │
│  …..                                                        │
│                                                             │
│                                                             │
└─────────────────────────────────────────────────────────────┘
```
